UI Documentation

GUILLON Nicolas – 2982043

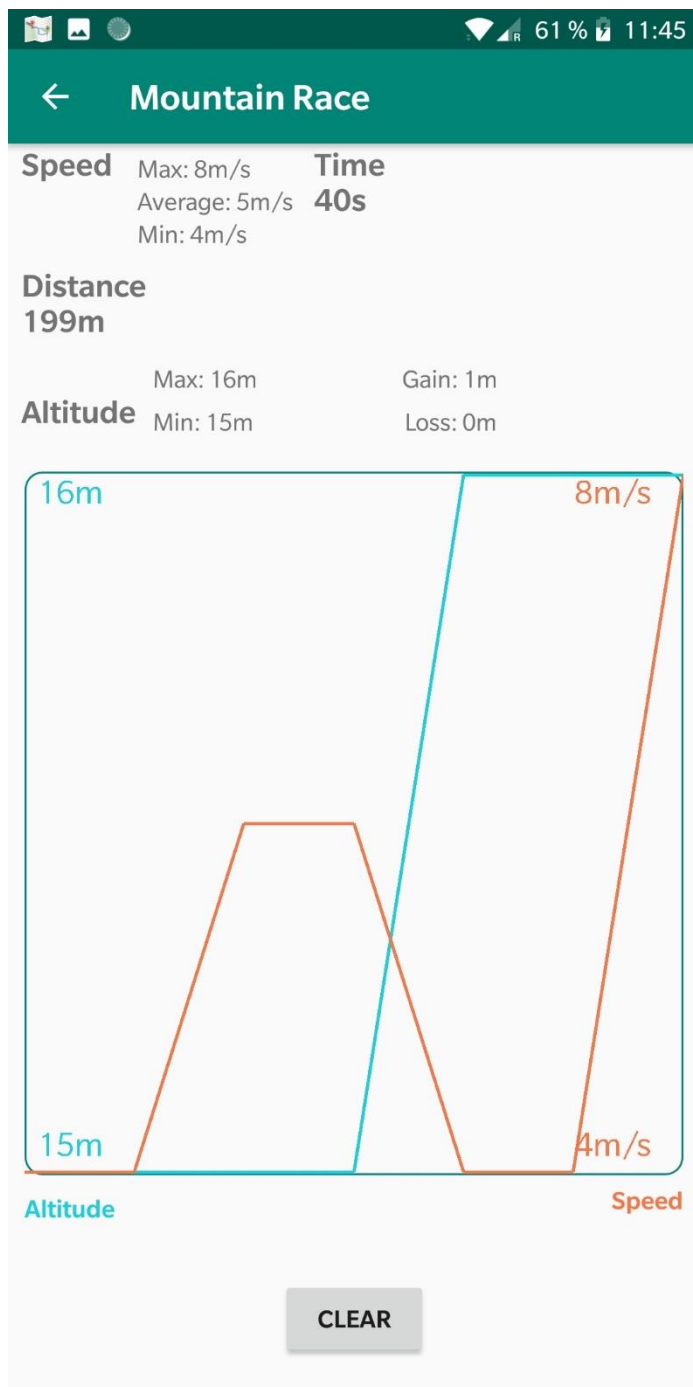

This is the main page of my application. The main goal of this app is to start tracking your location and display some statistics when the track is over.

I then simply put a start button at the center of the screen so the user knows what the screen is all about, it has one purpose, click on the button.

A color indicator is located just under it, so the user knows if the click has done something and if the location is being recorded.

I've chosen this background color because it is not an aggressive one and it doesn't disturb the user.

When the user will press again the button after a walk, he will come to this page.

A few statistics are displayed at the top of the screen. The font is small because there are many numbers to display and the user will only read these if he is interested in something specific.

Under these numbers is a graph containing values about the altitude and the speed. I've chosen two simple colors to represent these values, again to keep it soft to the eyes.

The max and min values of these parameters are displayed at the top and bottom of the graph, to make it easier for the user

to read.

When the user has finished to read the page, he might simply want to clean and start again, so the Clear button is located at the bottom center of the screen. The user also has the choice to keep the data and just return, using the Android back button from the device or the Action Bar.
